Qoid Rafif Bin Mohd Fadly

Computer Science with AI student · game & web developer in the making

University of Nottingham | Malaysia → China | Class of 2028

Malay · English · learning Mandarin

01 ABOUT ME

I'm a **Computer Science with Artificial Intelligence** student at the University of Nottingham. I love turning ideas into things people can actually play with — whether that's a **fast-paced game** or a **web app backed by a real database**.

So far I've built a fighting game in Java, a full-stack management system, a computer-vision tool driven by search algorithms, and a text analyser in C. I'm looking to keep growing as a developer and build projects that are both clever under the hood and fun to use.

02 EDUCATION

2025 – 2026
University of Nottingham Malaysia
BSc Computer Science with Artificial Intelligence

2026 – 2027
University of Nottingham Ningbo China
Study period at the China campus

2028
Graduation — UNM
Expected completion of degree

03 SKILLS

Languages & web

Java | JavaScript | Python | C | SQL | HTML | CSS

Tools & workflow

Git & GitHub | Jupyter | Team collaboration

Explored in projects

PHP | MySQL | Chart.js | A* search

04 WHAT I ENJOY

🎮 **Making games**
Gameplay, controls and the feel of play

🌐 **Building web**
Front to back, from UI to database

Selected projects

04 projects
games · web · AI · C

01

GAME DEVELOPMENT

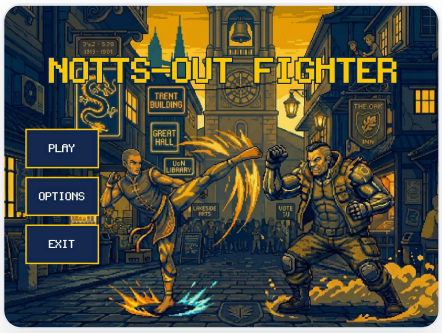

Notts-Out Fighter

Team project · COMP1023 · Group 17 · Java

A two-player pixel-art fighting game inspired by Street Fighter, set on a stylised University of Nottingham street.

- Built in Java with Gradle and LWJGL3, with automated GitHub Actions builds
- Designed with UML: use cases, class and sequence diagrams

My part: built the in-game timer, the pause system and the game menu.

Java · Gradle · LWJGL3 · UML · Git

02

FULL-STACK WEB APP

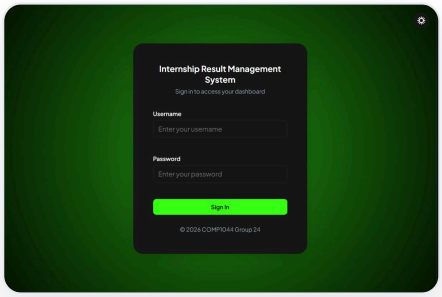

Internship Result Management System

Team project · COMP1044 Databases · Group 24

A web system for managing internship assessments, with separate dashboards for admins and assessors.

- Role-based login with hashed passwords and session-protected pages
- Full CRUD for users, students and internships
- Weighted scoring across 8 criteria, with charts for results

My part: managed the SQL side — the MySQL database behind the system.

PHP · MySQL · JavaScript · HTML/CSS · Chart.js

03

AI & COMPUTER VISION

A4 Document Corner Detection with A* Search

Team project · Fundamentals of AI · Group 29

Finds the four corners of an A4 sheet in messy real-world photos by treating detection as a search problem.

- Image pipeline: Difference-of-Gaussians, Canny edges and Hough line detection
- A* search over corner candidates, with geometric pruning for A4 shape
- Tested on 19 real photos: found a valid A4 shape in 18, with A*-h1 giving the best result in 14
- Benchmarked against BFS — the faster A* heuristic ran about 26% quicker on average

My part: wrote a large share of the base code for the detection pipeline, and contributed my own photos to the test dataset.

Python · Jupyter · A* search · Computer vision

SYSTEMS PROGRAMMING

Toxic Text Analyser

Solo project · My first project · COMP1028 · C

A command-line tool written in C that scans text and CSV files to detect toxic and cyberbullying language, then reports detailed statistics.

- Dictionary of 1,117 toxic words and phrases with three severity levels, editable from inside the program
- Word frequency, lexical diversity and toxicity scoring, plus side-by-side toxic vs. benign file comparison
- Implemented Bubble, Merge and Quick Sort and benchmarked them on real data
- Multi-file analysis, colour-coded terminal output, and report export to TXT or CSV

My first project: designed and built the whole program solo — around 4,400 lines of C across 17 source files.

C · Algorithms · File I/O · Memory management
